

A little structure. A clearer day.

You do not need a perfect routine. Start with one part of your life and two or three activities.

Sign in with an email code

THE SIMPLE IDEA

WHY THIS SCREEN EXISTS

RoutineOS separates deciding from doing. Set up the reusable parts once, prepare a specific day, then follow it without rebuilding your schedule.

- 1 Sign in**
Enter your email, request a code, then enter the six-digit code from your inbox.
- 2 Start in Library**
Create an area, then a routine. Videos are optional; ordinary tasks work too.
- 3 Prepare and follow a day**
Use Plan to choose outcomes, then lock the day. Today becomes your next-step screen.

TRY THIS / A REAL EXAMPLE

Study is an AREA. My Weekday is a ROUTINE. Finish lesson 3 is part of today's PLAN. TODAY tells you when to do it.

Start with Areas on the next page.

Give each priority a home.

An area is simply a name and color for a part of your life. It is not another task to complete.

Library > Areas: your life, grouped

THE SIMPLE IDEA

WHY THIS SCREEN EXISTS

Areas keep related activities and learning resources together. You can recognize Study, Work or Training at a glance instead of reading an unorganized list.

- 1 Create an area**
Open Library > Areas, tap New, choose a short name and a color, then save.
- 2 Use it in activities**
When making a routine, assign each activity to the area it belongs to.
- 3 Add resources if useful**
Attach videos or playlists to an area. You can keep multiple courses in the same area.

TRY THIS / A REAL EXAMPLE

Create Study in blue. Put DSA practice and JavaScript learning in Study. Both can use different courses without needing separate areas.

Next: give these activities times in a routine.

Build a day you can reuse.

A routine is a reusable schedule. An activity block is just one thing to do, with a start and end time.

Choose a saved routine

Edit its timed activities

WHY THIS SCREEN EXISTS

If your weekdays look similar, you should not have to enter the same schedule every morning. A routine supplies the shape; Plan adds that day's specifics.

- 1

Name it and choose weekdays

Open Library > Routines > New. Use a name like My Weekday and select the days it fits.
- 2

Add activity blocks

Set each title, time and area. Choose a default course when relevant, then save the routine.
- 3

Reuse or adapt

Copy another routine when making a variation. Edit routines for future plans; an already locked day stays fixed.

TRY THIS / A REAL EXAMPLE

My Weekday: 9-10 Study, 10-11 Work, 5-6 Training. A Weekend routine can have a different start time and fewer activities.

Next: add optional learning videos, or go straight to Plan.

Turn a long course into next steps.

Keep your courses with their area, then choose only the lessons you need for a particular activity.

Your saved courses and playlists

A long video split into chunks

WHY THIS SCREEN EXISTS

A saved link is easy to forget. A lesson attached to a planned activity gives you a specific place to continue, without hunting through tabs.

- 1

Add a YouTube link
Open Library > Videos > Add. Select an area and paste a public video or playlist link.
- 2

Load the lessons
Load the video information. For a long video, choose a chunk length; browse playlists as individual lessons.
- 3

Choose what belongs today
In Plan, choose the course and select its lessons or chunks. An area can contain several playlists and videos.

TRY THIS / A REAL EXAMPLE

Add a three-hour SQL video to Study. Split it into 30-minute chunks. Select the first chunk for today's study block; choose the next one when planning another day.

Videos are optional. Gym, errands and work blocks do not need them.

Decide what a good day looks like.

A routine gives you the times. A plan adds the output, notes and chosen lessons for one particular day.

Select a routine and prepare a block

Review activities and finalize the day

WHY THIS SCREEN EXISTS

Study is vague. Finish one lesson and solve two questions tells you what done means. Planning that detail now reduces decisions later.

- 1

Check the date and routine
If today is unplanned, Plan prepares today; otherwise tomorrow. Check the weekday-matched routine or select another.
- 2

Make each activity specific
Choose videos, write the output and add helpful notes. Finalize each block. Change titles, times and areas in the routine.
- 3

Review, then lock
Review the activity count and planned hours. Complete the confirmation steps to lock the day and send it to Today.

TRY THIS / A REAL EXAMPLE

Output: finish SQL chunk 1 and write five examples. Notes: use the practice database. Video: the first 30 minutes of the SQL course.

Leave room for meals and rest. The 18-hour cap is a limit, not a target.

Follow the day, one activity at a time.

This is your execution screen: the current activity, what comes next, and an honest record of what happened.

Current activity and connected timeline

Your progress and finished day

WHY THIS SCREEN EXISTS

You already made the decisions in Plan. Today keeps the next action visible so you can spend your attention on doing it.

- 1 Start with the current activity**
Check the active block and its time. If the day is empty, tap Plan Today to prepare it first.
- 2 Open Details when needed**
Tap the activity or Details to see the full output, notes and selected video links. A video count keeps the main card compact.
- 3 Record what happened**
Mark done or skipped, and undo a mark if needed. After all activities are done, you can export the day's PDF report.

TRY THIS / A REAL EXAMPLE

At 9:00, open Study, read your five-example output and play the chosen SQL chunk. Mark it done when finished. A missed activity does not erase the rest of your day.

No streak to protect. Make the record useful, not perfect.

Remember the errand when you arrive.

Locations are saved places. Reminders are the things you want to do at those places.

Locations: places you return to

Reminders: tasks attached to a place

WHY THIS SCREEN EXISTS

A shopping note cannot help if you forget to open it. An arrival reminder can bring the task back when you are near its saved place.

- 1
- Save a place**
In Locations, tap Add location. Search, select a point on the map or use your position. Check the pin, name and radius, then save.
- 2
- Attach the task**
In Reminders, add what you need to do and choose the saved place. Several tasks can belong to one location.
- 3
- Arrive, do it, tick it off**
Allow notifications and background location in Settings. Unfinished tasks stay attached; repeat nudges are requested while you remain inside.

TRY THIS / A REAL EXAMPLE

Save your supermarket, then add Buy milk. When arrival is detected, you get a nudge. Tick it off after buying it. Repeats stop after completion or a detected exit.

Android can delay detection and repeats. Reopen after Force stop; review location and battery settings.

Make it yours. Keep your work safe.

Choose how the app looks, how it alerts you and when to check your backup.

Profile, theme and notification preferences

Location access and backup status

WHY THIS SCREEN EXISTS

The right permissions make reminders useful. A recent backup protects the routines and plans you have already spent time building.

- 1

Choose your preferences

Set a name and photo, choose light or dark, and adjust notification sound and the start/end alert offsets.
- 2

Set up the reminders you use

Allow notifications for alerts. Arrival reminders also need background location. Follow the Android setup guidance for your phone.
- 3

Check your backup

Automatic backup runs every five minutes while online and active. Use Back Up Now before changing phones or uninstalling.

TRY THIS / A REAL EXAMPLE

Prefer a heads-up? Set the start alert to 10 minutes before a block. Before replacing your phone, run Back Up Now and check its time, then sign in on the new phone.
